

Shading, Haynes sound blends, shapes and forms to become the heart of your performance; delivering clean, free sound. HAYNES is the difference between authentically reproduced sound and border-line sound fidelity.

To achieve this accomplishment, Amplifier Corporation of America's staff of engineers and acoustical experts conducted elaborate, highly technical research, carefully analyzing each sound . . . producing THE new HAYNES Sound.

## EXCLUSIVE ALL MODULAR TRANSISTORIZED PLUG-IN BOARDS WITH GOLD PLATED CONTACTS

To assure clean precise sound reproduction, the new amplification technique of Haynes amplifiers employs the same type of transistors found in missiles and similar government projects. The transistors are the most reliable, longest lasting made. They are unaffected by humidity or climatic changes and have proven to be the very ultimate in dependability. No warm-up is required . . . you begin to play instantly.

Another advantage is the space-saving allowed by the small plug-in boards. These vibration-proof transistors do away with shock hazards. This advanced Haynes design permits many extras to be built into each amplifier . . . extras that would not be possible with larger vacuum tubes.

## You Must Hear It To Believe It!

- General • Fully modular a plug-in circuit board input for bass guitar, & acoustic ventilation by heavy duty speakers, a
- Electrical • No output input jacks for each ct quency interference • statically shielded pow formance • Completely • Red, on/off, push-by • AC outlet

Size: 30 inches wide; 21
